

(Queensland Globe, 2018)

Using spatial data with the Queensland Globe site we can determine the majorly developed areas within the proposed area in which we wish to construct the monorail lines.

This information also tells us the best possible location to construct the lines, being close to the shore line the monorail is sure to be used with a high density of people each and every day.

The selected route proposed aligns with the current proposed infrastructure planning, however the monorail the property acquisition is reduced to almost none and construction and environmental footprint is severely reduced.

In the future we propose to expand this project, to do this we will intend to construct monorail lines along major main roads, and create circle route within adjustment suburbs.
